Multi threaded programming and Lambda expressions

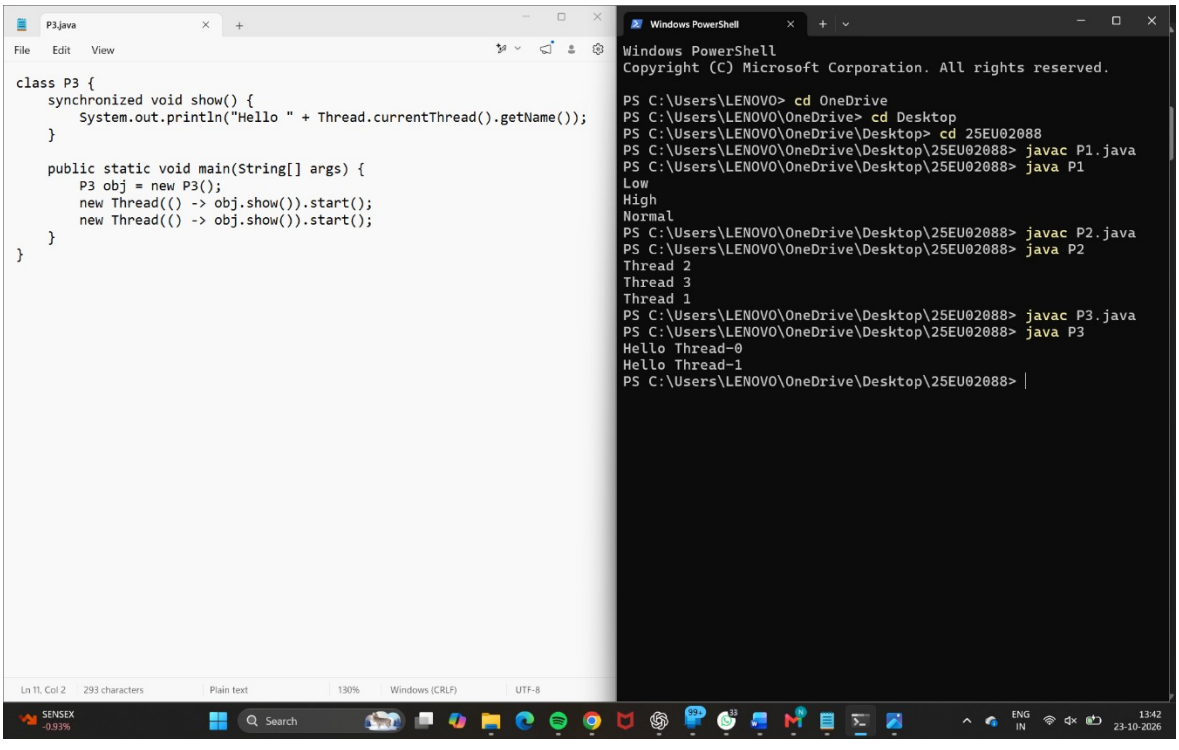

1.Write a Java program to create multiple threads and demonstrate different thread priorities using `MIN_PRIORITY`, `NORM_PRIORITY`, and `MAX_PRIORITY`.

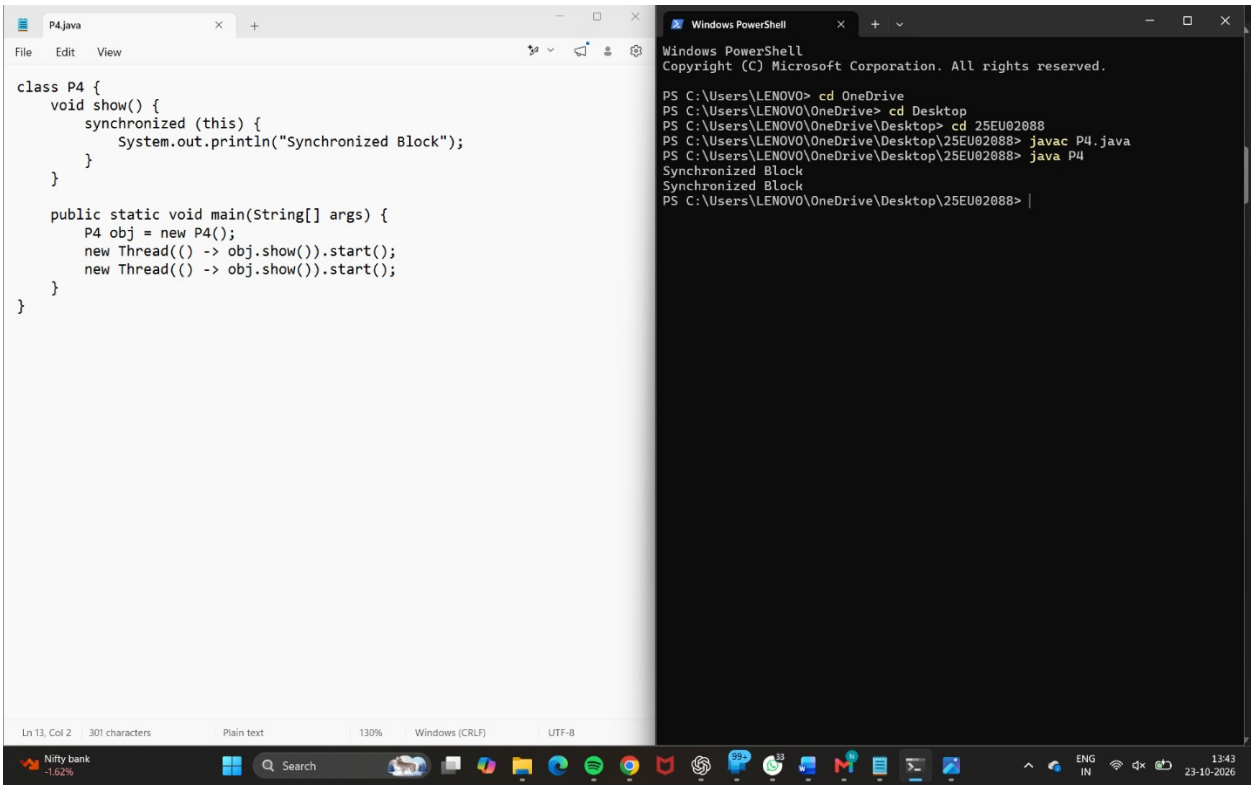

2.Write a Java program to create three threads with different priorities and observe their execution order.

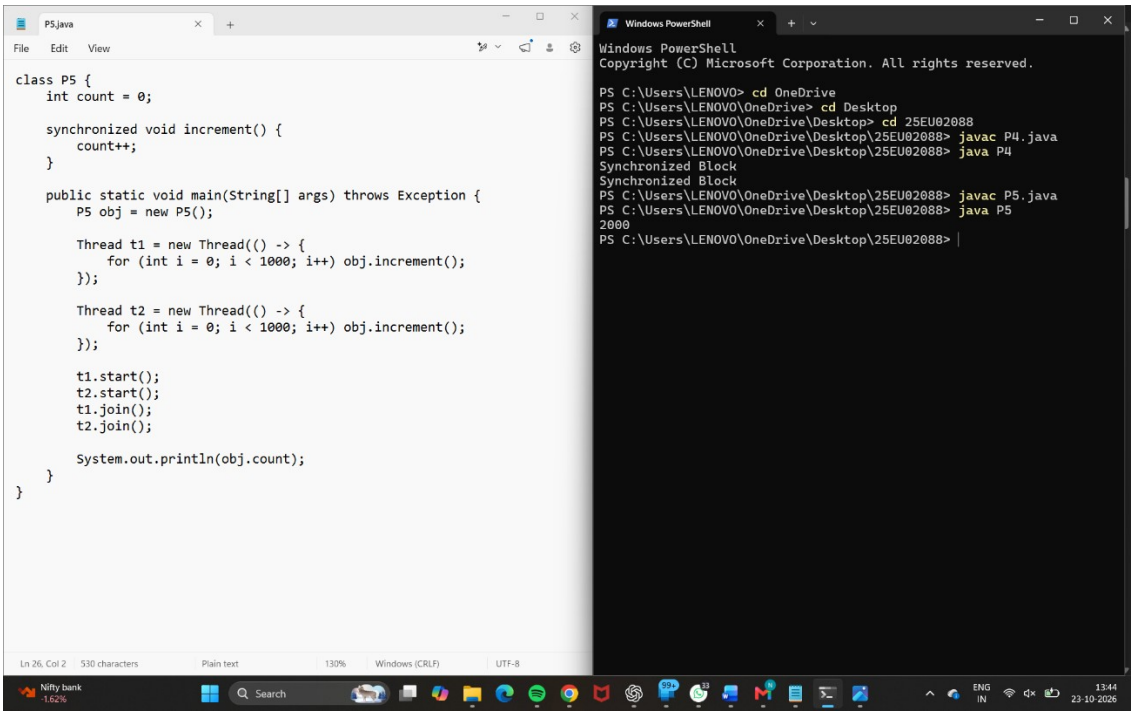

3. Write a Java program to demonstrate synchronization using a synchronized method for accessing a shared counter.

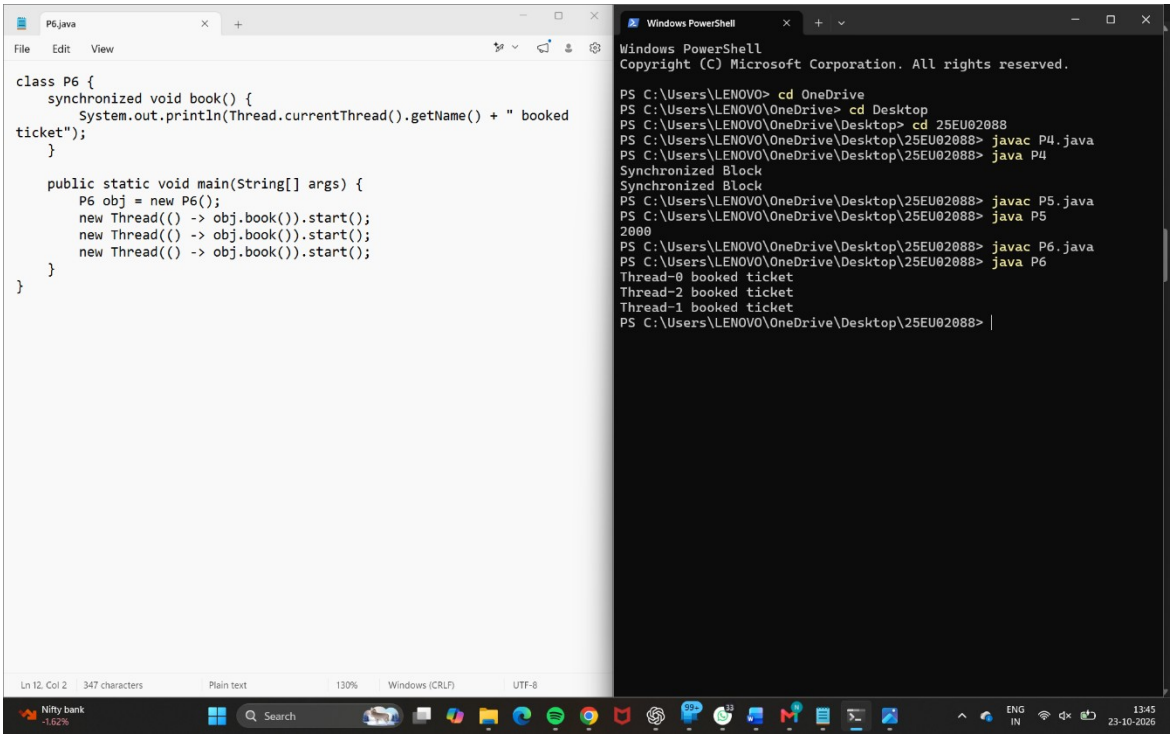

4. Write a Java program to demonstrate synchronization using a synchronized block.

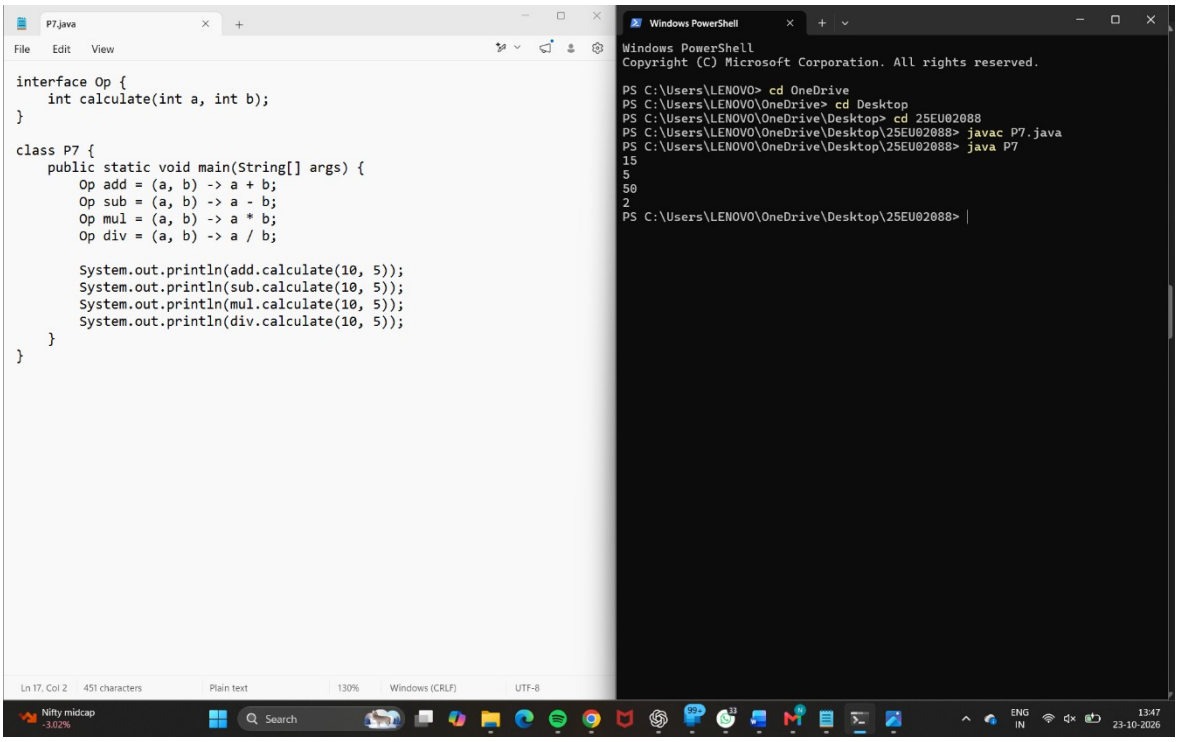

5. Write a Java program to demonstrate a race condition and eliminate it using synchronization.

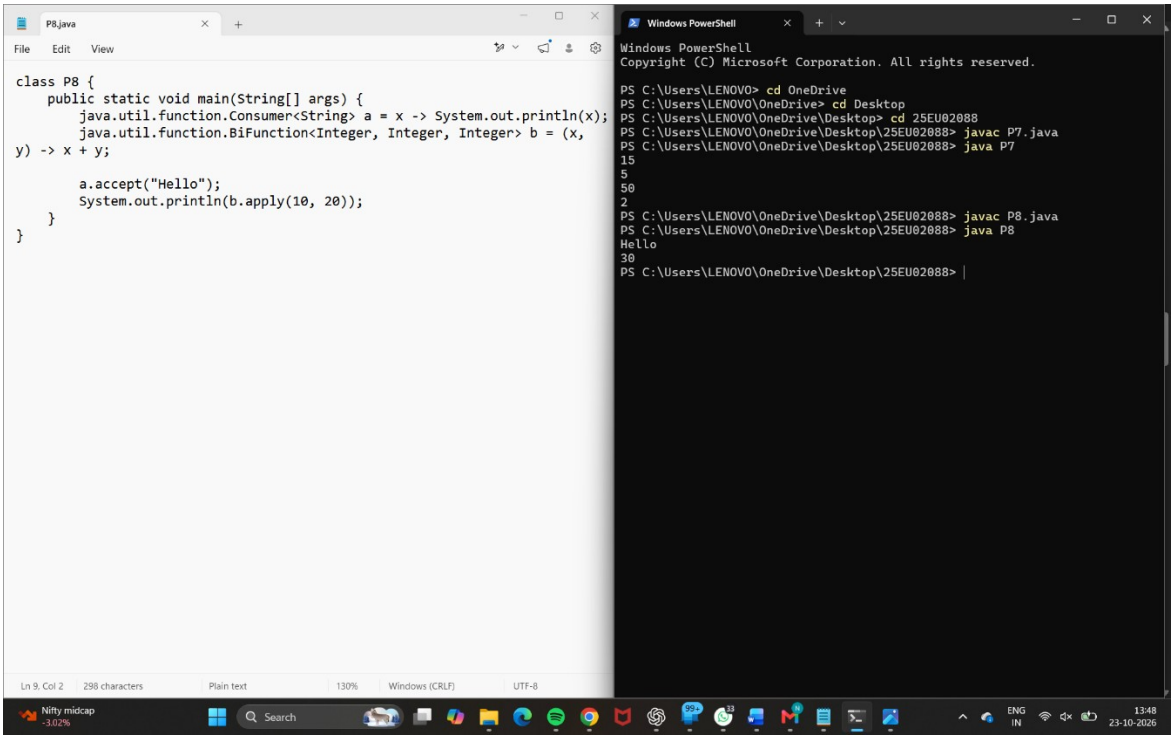

6. Write a Java program to implement a synchronized ticket-booking system where multiple threads attempt to book tickets simultaneously.

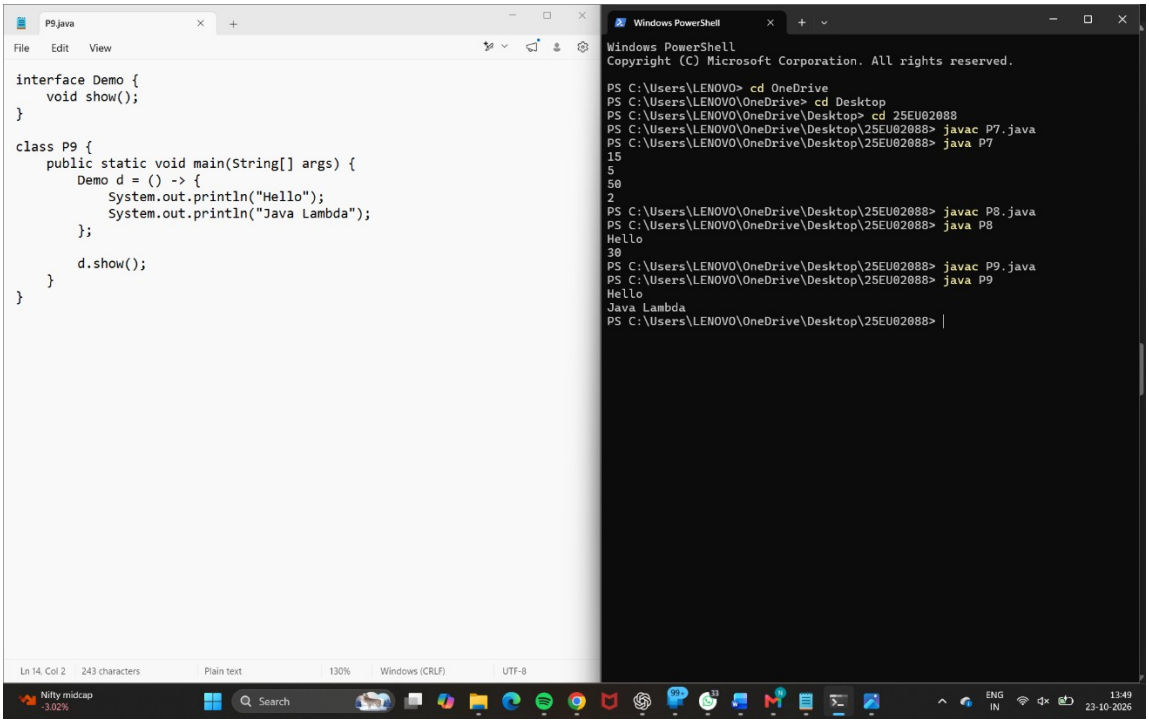

7. Write a Java program to introduce lambda expressions by implementing a functional interface for addition, subtraction, multiplication, and division.

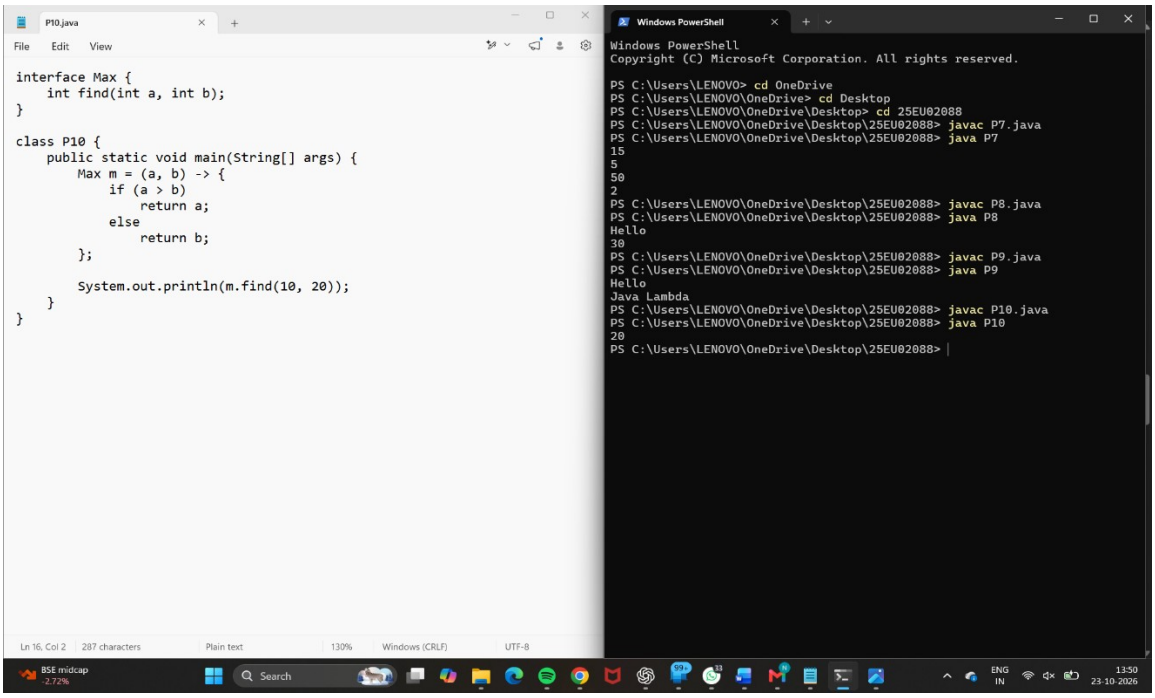

8. Write a Java program to demonstrate a lambda expression with a single parameter and multiple parameters.

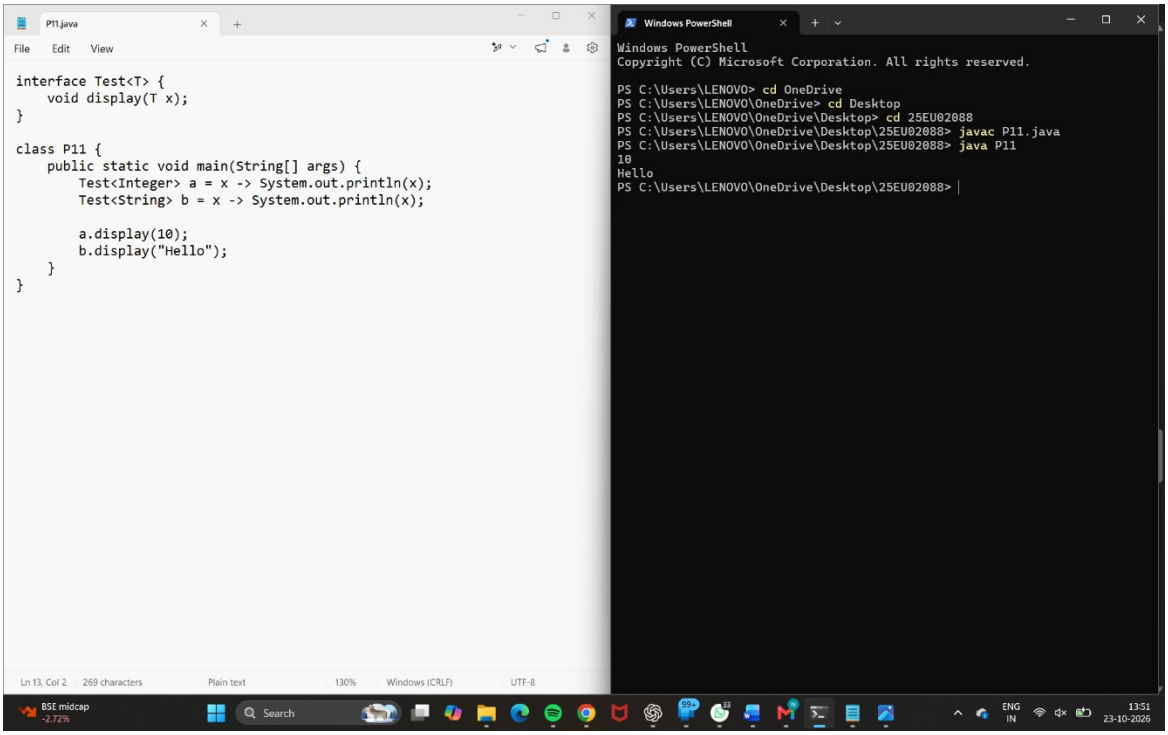

9. Write a Java program to demonstrate a block lambda expression containing multiple statements.

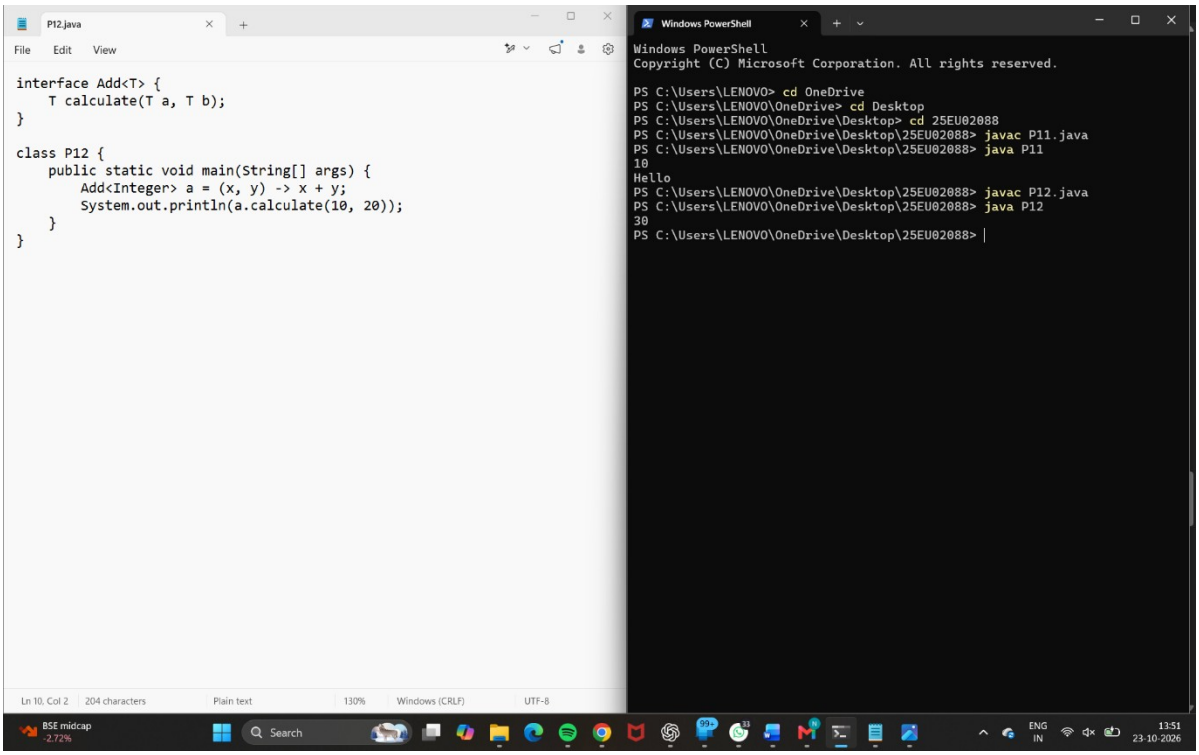

10. Write a Java program using a block lambda expression to find the largest of two numbers and return the result.

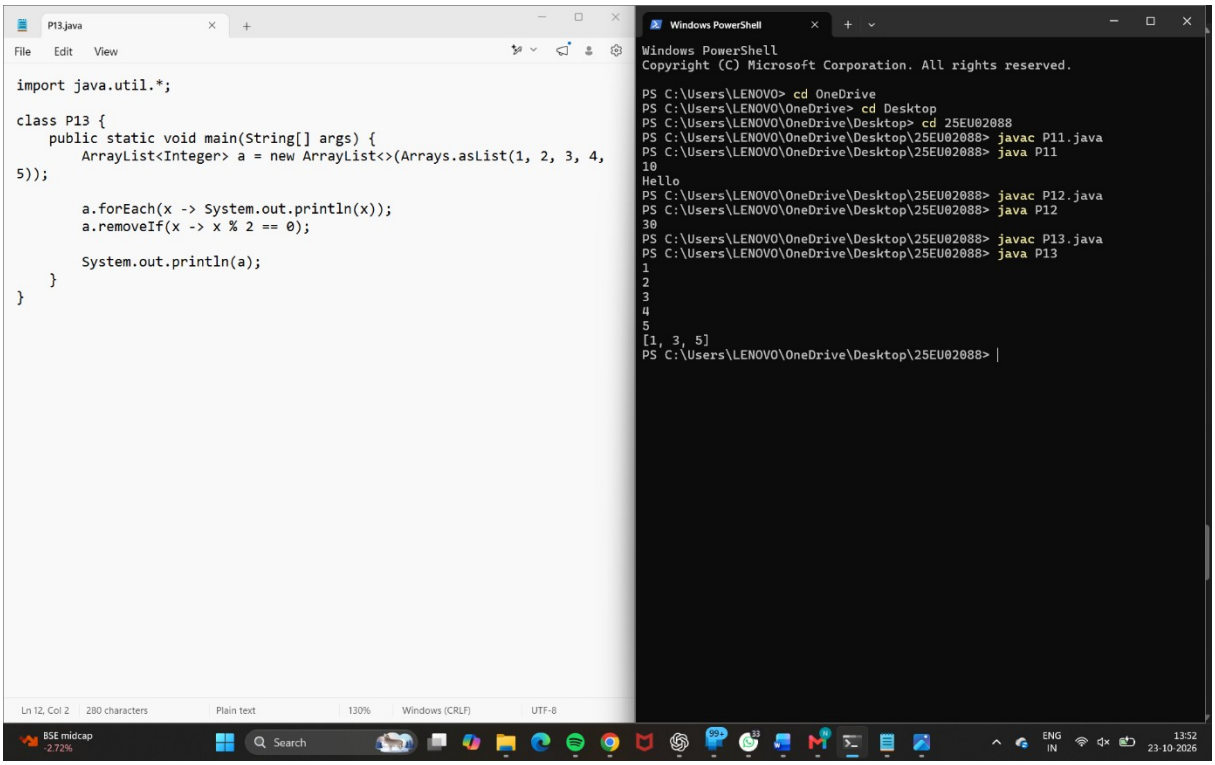

11. Write a Java program to create a generic functional interface and implement it using lambda expressions for different data types.

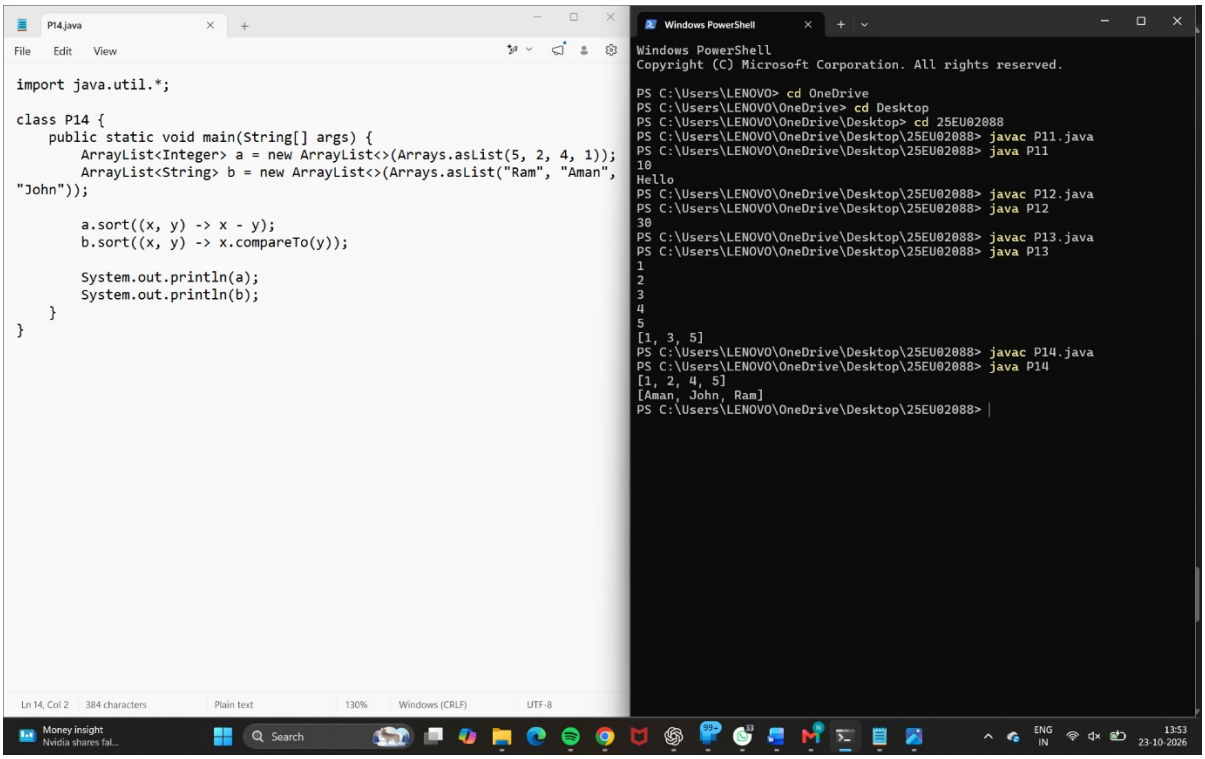

12. Write a Java program to create a generic functional interface that accepts two values and performs an operation using a lambda expression.

13. Write a Java program to use lambda expressions to display and filter elements of an `ArrayList`.

14. Write a Java program to sort a list of integers and strings using lambda expressions.

15. Write a Java program to create and execute a thread using a lambda expression.
